#### AUTHOR INDEX

Author	Session	Start page	Title
A A B C D E F G H I J K L I	MNOPO	QRSTUW	XYZ
Abadi, Imam	3E.3	716	Energy Management Efficiency and Stability Using Passive Filter in Standalone Photovoltaic Sudden Cloud Condition
Abdillah, Rahmad	3A.1	621	Facial Expression Recognition and Face Recognition Using a Convolutional Neural Network
Abdul-Jabbar, Jassim	3B.4	655	A Robust Iris Segmentation Algorithm Based on Pupil Region for Visible Wavelength Environments
Adi, Sumarni	1C.2	94	The Best Parameter Tuning on RNN Layers for Indonesian Text Classification
Aditya, Christian Sri Kusuma	1D.5	152	Comparative Analysis of DDoS Detection Techniques Based on Machine Learning in OpenFlow Network
Aditya, Trias	2G.5	604	<i>Comparison of the Latest DTM with DEM Pleiades in Monitoring the Dynamic Peatland</i>
Adrian, Ronald	1E.5	198	Roadside Unit Power Saving using Vehicle Detection System in Vehicular Ad-hoc Network
Afdhal, Afdhal	2E.3	509	Convolutional Network and Moving Object Analysis for Vehicle Detection in Highway Surveillance Videos
Affandi, Achmad	1 <b>G.</b> 1	267	A Combination of Defected Ground Structure and Line Resonator for Mutual Coupling Reduction
Agustina, Dina	1B.2	48	Prediction of forest fire occurrence in peatlands using machine learning approaches
Akbar, Renal	1D.6	158	Performance Analysis FSR and DSR Routing Protocol in VANET with V2V and V2I Models
Akhsanta, Muhammad	2E.6	525	Text-Independent Speaker Identification Using PCA-SVM Model
Al Aufa, Badra	2F.6	562	Measuring Instagram Activity and Engagement Rate of Hospital: A Comparison Before and During COVID-19 Pandemic
Al Maki, Wikky	1 <b>B.</b> 8	73	Hybrid Method for Flower Classification in High Intra-class Variation
Alam, Sahirul	1E.5	198	Roadside Unit Power Saving using Vehicle Detection System in Vehicular Ad-hoc Network

Alamsyah, Rangga	3B.2	646	Speech Gender Classification Using Bidirectional Long Short Term Memory
Alfi, Farah	1F.2	227	Quality Assessment of Digital Terrestrial Television Broadcast in Surabaya
Ali, Tarig Ahmed El Khider	1B.7	68	Risk Prediction of Major Depressive Disorder using Artificial Neural Network
Alief, Fahdiaz	1F.3	233	Android Forensic Tools Analysis for Unsend Chat on Social Media
Amalia, Yasmin	2D.2	457	Benchmarking Explicit Rating Prediction Algorithms for Cosmetic Products
Amanaf, Muntaqo	1G.3	278	5G New Radio (NR) Network Planning at Frequency 2,6 GHz in The Gold Triangle Area of Jakarta
Ambarwari, Agus	2B.7	389	Design and prototype development of internet of things for greenhouse monitoring system
Andriyani, Widyastuti	2B.6	383	A Comparative Study of Java and Kotlin for Android Mobile Application Development
	1B.2	48	Prediction of forest fire occurrence in peatlands using machine learning approaches
Anggraeni, Martianda	1F.2	227	Quality Assessment of Digital Terrestrial Television Broadcast in Surabaya
Annisa, Fadhilah Qalbi	1 <b>B.8</b>	79	Personality Dimensions Classification with EEG Analysis using Support Vector Machine
Antonius, Suyanto	2E.7	529	Center of Gravity Method for Finding Center of Laser Beam Projection on Landslide Measurement
Anugraha, Tides	1D.3	140	Experimental Security Analysis for Fake eNodeB Attack on LTE Network
Anwar, Muchamad Taufiq	1C.1	83	Performance Comparison of Data Mining Techniques for Rain Prediction Models in Indonesia
Archi, Muhammad	1E.2	182	Initial Access in 5G mmWave Communication using Hybrid Genetic Algorithm and Particle Swarm Optimization
Ardiansyah, Agus	2B.5	377	Prototype Design of IoT (Internet of Things)-based Load Monitoring System
Arfian, Nur	2B.1	354	The User Experience effect of Applying Floating Action Button (FAB) into Augmented Reality Anatomy Cranium Media Learning Prototype
Ariananda, Dyonisius	1F.5	245	Single Snapshot-Spatial Compressive Beamforming for Azimuth Estimation and Backscatter Reconstruction

Aripriharta, A.	2B.4	371	Development of The Personnel Monitoring System Using Mobile Application and Real-Time Database During the COVID19 Pandemic
Arisanty, Deasy	1B.2	48	Prediction of forest fire occurrence in peatlands using machine learning approaches
Arisya, Khairunnisa	1D.8	170	Measurement of Information Security Awareness Level: A Case Study of Online Transportation Users
Armin, Farid	1G.4	284	Modification of 2.2 GHz S-Band Rectangular Patch Microstrip Antenna using Truncated Corner Method for Satellite Applications
	1G.5	289	Design of Optimal Satellite Constellation for Indonesian Regional Navigation System based on GEO and GSO Satellites
Arwoko, Heru	3D.1	682	Fruits Classification from Image using MPEG-7 Visual Descriptors and Extreme Learning Machine
Asfihani, Tahiyatul	1G.8	306	Ship Heading Control Using Nonlinear Model Predictive Control
Asriningtias, Salnan	1A.2	7	Blackbox Testing Model Boundary Value of Mapping Taxonomy Applications and Data Analysis of Art and Artworks
Astuti, Eha Renwi	3C.2	661	The Use of Pre and Post Processing to Enhance Mandible Segmentation using Active Contours on Dental Panoramic Radiography Images
Astuti, Yenni	3B.1	642	Comparison of Feature Extraction for Speaker Identification System
Asyrofi, Rakha	2A.5	332	Extraction Dependency Based on Evolutionary Requirement Using Natural Language Processing
B A B C D E F G H I	JKLMNOPQE	<b>R S T U W</b>	XYZ

Basari, Basari	2B.3	365	Proximity-based COVID-19 Contact Tracing System Devices for Locally Problems Solution
Bejo, Agus	3B.1	642	Comparison of Feature Extraction for Speaker Identification System
	1B.3	52	Speaker Recognition Using Mel Frequency Cepstral Coefficient and Self-Organising Fuzzy Logic
Belangour, Abdessamad	3A.4	638	A Kubernetes Algorithm for scaling Virtual Objects
Borman, Rohmat	2E.5	520	Indonesian Traffic Sign Recognition For Advanced Driver Assistent (ADAS) Using YOLOv4

Budi Setiawan, Fajar	1E.8	215	Performance Enhancement in Macro-Femto Network Using a Modified Discrete Moth-flame Optimization Algorithm
Budiman, Edy	2D.7	482	Dayak Onion (Eleutherine palmifolia (L) Merr) as An Alternative Treatment in Early Detection of Dental Caries using Certainty Factor
Bustamam, Alhadi	1A.6	26	The Multimodal Transfer Learning for Diagnosing COVID-19 Pneumonia from Chest CT-Scan and X- Ray Images
C A B C D E F G H I J K	LMNOPO	QRSTUW	X Y Z
Cahyani, Denis	1B.4	56	Indonesian Parsing using Probabilistic Context- Free Grammar (PCFG) and Viterbi-Cocke Younger Kasami (Viterbi-CYK)
Chotimah, Khusnul	1G.8	306	Ship Heading Control Using Nonlinear Model Predictive Control
D A B C D E F G H I J K	LMNOPO	QRSTUW	XYZ
Daelami, Ahmad	2F.5	551	Development of Temperature and Humidity Control System in Internet-of-Things based Oyster Mushroom Cultivation
Darari, Fariz	2D.2	457	Benchmarking Explicit Rating Prediction Algorithms for Cosmetic Products
Delfianti, Rezi	3E.3	716	Energy Management Efficiency and Stability Using Passive Filter in Standalone Photovoltaic Sudden Cloud Condition
Dewantara, Mahardira	2C.1	400	Minimization of Power Losses through Optimal Placement and Sizing from Solar Power and Battery Energy Storage System in Distribution System
Dirgantoro, Burhanuddin	2E.4	514	Speaker Recognition For Digital Forensic Audio Analysis Using Support Vector Machine
Djawas, Faizah	2F.6	562	Measuring Instagram Activity and Engagement Rate of Hospital: A Comparison Before and During COVID-19 Pandemic
Dwijayanti, Suci	3A.1	621	Facial Expression Recognition and Face Recognition Using a Convolutional Neural Network
Dwiputra, Richard	1E.6	203	Network Attack Detection System Using Filter- based Feature Selection and SVM
E A B C D E F G H I J K	LMNOPQ	QRSTUW	XYZ
Eka Sari, Wahyuni	18.1	42	Papaya Disease Detection Using Fuzzy Naïve Bayes Classifier

Ekaniza, Raki	1 <b>A.</b> 5	21	PSO-Learned Artificial Neural Networks for Activity Recognition
Eko Sulistyo, Meiyanto	2C.6	428	Design and Development of Bit Error Measurement using FPGA for Visible Light Communication
El Khalyly, Badr	3A.4	638	A Kubernetes Algorithm for scaling Virtual Objects
Elsa, Corry	2G.1	577	Case Study: AppDynamics Application as Business Intelligence to Support Digital Business Operations at PT PGD
Emanuel, Andi Wahju Rahardjo	1C.3	100	Influence Distribution Training Data on Performance Supervised Machine Learning Algorithms
Engel, Ventje	1E.6	203	Network Attack Detection System Using Filter- based Feature Selection and SVM
F A B C D E F G H I J K L	MNOP	QRSTUW	X Y Z
Fachrie, Muhammad	2G.1	583	Guided Genetic Algorithm to Solve University Course Timetabling with Dynamic Time Slot
Fadhilah, Amanda	1 <b>D.</b> 8	170	Measurement of Information Security Awareness Level: A Case Study of Online Transportation Users
Fahmi, Fahmi	2B.4	371	Development of The Personnel Monitoring System Using Mobile Application and Real-Time Database During the COVID19 Pandemic
Fahrudin, Tresna	2A.7	344	Indonesian Stock Price Prediction including Covid19 Era Using Decision Tree Regression
Fanani, M.	1C.7	117	Implementation of Maximum Power Point Tracking on PV System using Artificial Bee Colony Algorithm
Faraby, Muhira	2C.4	418	The Single Tuned Filter Planning to Mitigate Harmonic Pollution in Radial Distribution Network Using Particle Swarm Optimization
Fardan, Fardan	1D.3	140	Experimental Security Analysis for Fake eNodeB Attack on LTE Network
Farrell, Mochammad	2E.3	505	Combined Firefly Algorithm-Random Forest to Classify Autistic Spectrum Disorders
Fatichah, Chastine	3C.2	661	The Use of Pre and Post Processing to Enhance Mandible Segmentation using Active Contours on Dental Panoramic Radiography Images
Ferdiansyah, Indra	1C.7	117	Implementation of Maximum Power Point Tracking on PV System using Artificial Bee Colony Algorithm

	2C.3	412	Design and Implementation of SVPWM Inverter to Reduce Total Harmonic Distortion (THD) on Three Phase Induction Motor Speed Regulation Using Constant V/F	
	2C.2	406	Three Phase Induction Motor Dynamic Speed Regulation Using IP Controller	
Firdaus, Diash	1D.7	164	DDoS Attack Detection in Software Defined Network using Ensemble K-means++ and Random Forest	
Firdaus, Diaz	2D.6	476	Topic-Based Tweet Clustering for Public Figures Using Ant Clustering	
Fitria, Irma	1G.8	306	Ship Heading Control Using Nonlinear Model Predictive Control	
Fitriati, Andi	2C.4	418	The Single Tuned Filter Planning to Mitigate Harmonic Pollution in Radial Distribution Network Using Particle Swarm Optimization	
Frannita, Eka	2E.2	499	Supervised Deep Learning for Thyroid Nodules Classification Based on Margin Characteristic	
G A B C D E F G H I J K L	M N O P	QRSTUW	XYZ	
Ginting, Ishak	1D.3	140	Experimental Security Analysis for Fake eNodeB Attack on LTE Network	
Gitakarma, Made Santo	1F.1	221	Designing Wireless Sensor Network Routing on Agriculture Area Using The LEACH Protocol	
Gumilar, Langlang	3E.2	711	Variations in the Placement of DFIG in the Power System to Changes of Short Circuit Current	
Gunawan, Dadang	1E.2	182	Initial Access in 5G mmWave Communication using Hybrid Genetic Algorithm and Particle Swarm Optimization	
Gupta, Anju	2C.9	445	Robust Control Design Procedure and Simulation of PRES Controller having Phase-Locked Loop(PLL) control technique in Grid-Tied Converter	
H A B C D E F G H I J K L M N O P Q R S T U W X Y Z				
Hadikurniawati, Wiwien	1C.1	83	Performance Comparison of Data Mining Techniques for Rain Prediction Models in Indonesia	
Halim, Arwin	2A.4	326	Optimization of SV-kNNC using Silhouette Coefficient and LMKNN for Stock Price Prediction	
Hamed, Fatima	1B.7	68	Risk Prediction of Major Depressive Disorder using Artificial Neural Network	

Hamka Ibrahim, Muhammad	2C.6	428	Design and Development of Bit Error Measurement using FPGA for Visible Light Communication
Hanifa, Annisa	2C.6	428	Design and Development of Bit Error Measurement using FPGA for Visible Light Communication
Harintaka, Harintaka	2G.5	604	Comparison of the Latest DTM with DEM Pleiades in Monitoring the Dynamic Peatland
Hartanto, Rudy	2B.1	354	The User Experience effect of Applying Floating Action Button (FAB) into Augmented Reality Anatomy Cranium Media Learning Prototype
	2G.3	593	Multi-Point Travel Destination Recommendation System In Yogyakarta Using Hybrid Location Based Service-Floyd Warshall Method
Hasibuan, Siti	1 <b>B.3</b>	52	Speaker Recognition Using Mel Frequency Cepstral Coefficient and Self-Organising Fuzzy Logic
Hasim, Sitronella	1F.8	262	Performance Evaluation of Cell-Edge Femtocell Densely Deployed in OFDMA-Based Macrocellular Network
Hastuti, Puji	2G.4	599	Application For Detection Of Pedestrian Position On Zebra Cross

Abstract— The growth of the Internet of Things (IoT) presents challenges in the field of security. The Intrusion Detection System is an alternative to protecting the internet of things. In this study, we propose an intrusion detection system model that combines unsupervised algorithm and a deep neural network. Autoencoder as unsupervised learning algorithm has a function as a feature extractor that speeds up the learning process on a deep neural network. The performance of a deep learning model depends heavily on the selection of hyperparameters of neural network architecture. In this case, we used Bayesian Hyperparameter Optimization to perform hyperparameter tuning of deep learning models with various activation and weight initialization techniques. The accumulation result is useful to help determine the correct activation function and weight initialization and the hyperparameters that most influence the deep learning model. The results of this study show that Bayesian hyperparameter optimization can improve classification results significantly. Evaluation using the BoT-IoT dataset, the classification accuracy results in deep learning model can reach 99.99%.

### Keywords—Attack classification, hyperparameter, Bayesian optimization, Intrusion detection system, IoT

#### I. INTRODUCTION

The Internet of Things (IoT) is a significant component of industrial automation. A complex paradigm is a way of securing an IoT system that links billions of devices with different characteristics [1]. Different new threats begin to emerge and grow more sophisticated. This increases the need for intelligent security solutions to secure data in IoT networks, namely the Intrusion Detection System (IDS) [2].

Various machine learning (ML) and deep learning (DL) algorithms have been proven to be used in the research area of intrusion detection systems [3]. Especially for DL, some techniques have been widely implemented for anomaly-based IDS such as Deep Neural Network (DNN), Recurrent Neural Network (RNN), Deep Belief Network (DBN) [4]. However, the design of the deep learning model itself has several hyperparameters which need to be decided when constructing and training the model. In order to achieve optimal performance of DL architectural model, the right hyperparameters must be determined [5].

The optimisation method for hyperparameters in deep learning models is a costly computational problem. It takes

several hours or even days to evaluation some hyperparameter configuration manually. The tuning process can be done automatically with various methods such as Grid search [12], Random search [14], and Bayesian optimization [6], [15] which is more flexible than manually tuning hyperparameters (trial and error) on deep learning models. Among these methods, Bayesian optimization can produce better and faster configurations than HPO with grid search and random search techniques [5], [15]

Contributions in this study include are: (1) we proposed deep learning models using unsupervised autoencoder and supervised deep neural networks using the Bayesian hyperparameter optimization approach; (2) The results of this study also evaluate the use of ReLU variant activation function in deep learning model so it can help determine the proper activation function in deep learning model; (3) In evaluation process we used various weight initialization techniques to evaluate the impact of initialization technique to the activation function.

We list the abbreviations and acronyms used in the paper as a quick and convenient guide in Table 1.

TABLE I.	ACRONYMS AND ABBREVIATIONS LIST
----------	---------------------------------

ANN	Artificial Neural Network
BO	Bayesian Optimization
DAE	Deep Autoencoder
DDoS	Distributted Denial of Services
DL	Deep Learning
DNN	Deep Neural Network
DoS	Denial of Service
ELU	Exponential Linear Unit
HPO	Hyperparameter Optimization
IDS	Intrusion Detection System
IoT	Internet of Things
ML	Machine Learning
NIDS	Nework Intrusion Detection System
PreLU	Parametric ReLU
ReLU	Rectified linear units
SELU	Scaled Exponential Linear Unit
SMOTE	Synthetic Minority Oversampling Technique

The rest of this paper is structured accordingly. In Section 2, we briefly analyze some relevant works corresponding to a state-of-the-art method of deep learning and optimization of hyperparameters in the framework of intrusion detection. Section 3 presents our proposed DL architecture, and some

This research has received funding from Indonesia Ministry of Research,

Technology, and Higher Education (grant agreement 170/SP2H/LT/DRPM/2020).

methods of our work are used. We give explanations of our experiments in Section 4 and present the results. Finally, in section 5, we end this paper with a few remarks.

#### II. RELATED WORK

Utilization of deep learning (DL) in intrusion detection systems has succeeded in improving accuracy and attack recognition [7]. The classification performance of the DL model depends on the architecture of the DL. Some researchers use various autoencoder variants in NIDS for feature learning processes combined with different classifiers [8]–[11]. Author Yang et al. [8] combined improved conditional variational autoencoder (ICVAE) with a deep neural network. In the process to get the best model, a manual grid search was performed to determine hyperparameters such as the number of hidden layers, the number of nodes, the learning rate, and L2.

Other researchers Rezvy et al. [9] used an AE autoencoder in combination with a dense neural network. AL-Hawawreh et al. [10] proposed Deep Autoencoder (DAE) in combination with the Deep Feed Forward Neural Network (DFFNN) as a classifier. Zhao et al. [11] proposed method to identify new forms of attacks through a Semi-Supervised Discriminant Auto-encoder (SSDA) combined with a heuristic denoising

Most of the selection of DL model structures such as the number of nodes, the number of hidden layers and several other hyperparameters in previous researches performed manually (trial and error) or with a limited combination of grids. In fact, model performance is very sensitive to hyperparameter layout as shown by Pawlicki 2019 [12] which uses manual grid search to find hyperparameter epoch, batch size, activation function, optimizer, number of hidden layers and number of neurons in Artificial Neural Network (ANN) based on NIDS. The hyperparameter tuning process is essential to improve deep learning performance [6], [13].

#### III. METHOD AND DESIGN

#### A. Proposed Model

In our previous study [16], we used the autoencoder based feature extraction with various activation functions and a varied number of nodes. The results of this study show the activation function, and the number of nodes in the hidden layer significantly determine the detection and classification performance. However, the process of feature extraction in the intrusion detection system [16] still uses manual search based on trial and error and is very time-consuming. For this reason, in this research, we propose an intrusion detection system with an autoencoder pre-training process and a DNN classification with a hyperparameter tuning process based on Bayesian optimization (BO).

The phases of the proposed model can be seen in Figure 1, which starts by choosing a dataset and pre-processing dataset. For pre-training, the deep learning model uses an unsupervised autoencoder algorithm which extracts features. The encoder layer model will be transferred to a classifier using a deep neural network. To improve accuracy performance, we used automatic hyperparameter tuning based on a Bayesian optimization (BO). The evaluated hyperparameters are learning rate, number of nodes on a hidden layer, batch size, activation function and weight initialization. One of the focuses of this research is to investigate the effect of hyperparameter tuning on deep learning models using only 1 hidden layer. The Gaussian BO function automatically updates the hyperparameter value to the model evaluated by a certain number of iterations to obtain the best results.

Fig. 1. Deep Learning Architecture-based Attacks classification

#### B. Dataset

This study uses the Bot-IoT dataset [17], which represents an attack on the IoT environment. This dataset has been selected because it represents a quite realistic IoT attack environment compared to the previous dataset. This dataset consists of four types of attacks, namely DoS, DDoS, information gathering and information theft. The attack types are grouped into eleven sub-classes as in Table 2. The number of records from the dataset is quite large, more than 72 million records. In this experiment, we used the 5% version of the entire dataset that consists of 46 features.

TABLE II. COMPOSITION OF THE BOT-IOT DATASET USED

		Flow	Training-	Testing-	Training-set
Category	Sub Category	count	set	set	SMOTE
Normal	Normal	477	381	96	50000
	UDP	1032975	826412	206563	826412
DoS	TCP	615800	492826	122974	492826
	HTTP	1485	1217	268	50000
	UDP	948255	758690	189565	758690
DDoS	TCP	977380	781607	195773	781607
	HTTP	989	787	202	50000
Dagammaiagamaa	Service_Scan	73168	58470	14698	58470
Reconnaissance	OS_Fingerprint	17914	14364	3550	50000
Theft	Keylogging	73	59	14	50000
Inen	Data_Exfiltration	6	7	3	50000
Total		3668522	2934820	733706	3218005

In feature selection From 46 features of the BoT-IoT dataset [17], there were several features were eliminated, i.e. pkSeqID, stime, flgs\_number, proto\_number, saddr, sport, daddr, dport, state number, and ltime. These features were eliminated due to some duplication of features, and other features are more specific to the identity of packages that are not related to an attack's characteristics. Next step, we applied feature modification in label subcategory by merging label category-subcategory to facilitate the grouping of attack types. Then attack, category and subcategory features are used as labels. In the feature encoding process, we used a one-hot encoding method for nominal or categorical features in flags, protocol and state. The feature flag was mapped to 9 features, and the feature protocol became 5, the feature state became 11. Feature labels have also been mapped into five classes for categories and eleven classes for subcategory. After the encoding process, the overall features of the data set were transformed into 56 features, which became the input features of the deep learning model.

Furthermore, the dataset was divided into 80% into training sets and 20% into testing sets. Specifically, for the data\_exfilteration class, we added data redundancy for the balanced process of the datasheet. The number of classes of the subcategory itself is very imbalanced, especially for the theft attack category (see table 2). We used the Synthetic Minority Oversampling Technique (SMOTE) method to generate balanced data then the IDS model could detect all class attacks correctly. This balanced SMOTE process was only carried out on the training set data by upsampling from small data to 50000 samples.

The last step, Feature scaling is a process to convert data into a specific range. In this phase, the feature scaling process on training-set and testing-set uses Min-max scaling with a range of [0.1]. Then the data is ready to be used on the deep learning model

#### C. Deep Learning Model

Figure 1 shows a proposed deep architectural model. The deep learning model uses a pre-training process using an unsupervised autoencoder and a fine-tuning process with a supervised DNN. The pre-training process with this autoencoder is useful for extracting knowledge from unsupervised training sets. Autoencoder consists of 2 stages of encoding and decoding. The encoding process will compress the input data into a low-dimensional

representation. Then the decoder process will reconstruct the low-dimensional data from the encoder so that the output results from this autoencoder process produce an output that is close to the input data. The encoder vector function h is denoted as given in (1).

$$z = f(W.x + b) \tag{1}$$

W is the weight matrix, and b is the bias vector, x is the input feature vector, while f(.) is the activation function used.

The decoder function returns the vector z to the output vector  $\hat{x}$ , which has the same dimension as the input.

$$\hat{x} = f(W^T \cdot h + b') \tag{2}$$

The activation function f(.) in this decoded process used sigmoid. The loss function uses the mean square error (MSE) that will minimize the difference between the input and output vectors.

Then by using the encoding vector z, which is a representation of the extracted data, will be transferred to the DNN model. So the DNN model will consist of 3 layers, namely the input layer and the hidden layer that comes from the encoding layer, is then added to the output layer using softmax activation. In supervised DNN, using bias values and matric weights transferred from the encoding layer is retrained to predict label class. Output labels will be evaluated in each iteration using categorical cross-entropy as loss function, and adam as optimizer function.

#### D. Bayesian Optimisation

Bayesian Optimization (BO) is an optimization model that generates predictive distributions of potential value with a probability approach to optimize the Blackbox function to be optimized [18]. This Bayesian optimization process will look for the next sampling point  $x_t$  value by optimizing the acquisition function using the Gaussian process:

$$x_t = argmax_x u(x|D_{1:t-1}) \tag{3}$$

Where  $t = 1, 2, \cdots$  is an iteration for several samples of hyperparameter combinations to be evaluated, x is the hyperparameter value to be observed. u is the acquisition function, and  $D_{1:t-1}$  is the posterior distribution to be optimized.

In this experiment, we use the Expected Improvement (EI) (in equation 4) as acquisition function to take a sample from the

$$EI(\mathbf{x}) = \mathbb{E}max(f(\mathbf{x}) - f(\mathbf{x}^+), 0)$$
(4)

 $f(x^+)$  represents the best sample value to far and  $x^+$  is the sample 's position.

#### E. Performance Metrics and Environment Setup

Evaluation of deep learning after hyperparameter optimization used accuracy as a metric performance. We also observed the time required to see the impact of the activation and kernel initialization functions on the model in the deep model training phase. After obtaining the most accurate performance of the model, it is evaluated using the testing-set. The experiment was conducted using Python on the Google Collaboratory framework using the Tensorflow and Keras libraries. The Bayesian Optimization Hyperparameter Method used the Skopt Optimization Library [19] to produce the best model. Some of the hyperparameter values that the tuning process performs include the value of the learning rate, the number of hidden layer nodes, the activation function, and the initial kernel (see Figure 1).

The pre-training process for the autoencoder and finetuning of the deep learning model only uses 10 epochs each stage. When training the DNN model, the training set that has been upsampled with SMOTE becomes 3,218,005 records data, 80% split for the learning process, and 20% for the validation process. The best model obtained is re-evaluated using a testing-set of 733,706 data.

#### IV. RESULTS AND DISCUSSION

#### A. Results of Bayesian Optimization

BO is only effective on continuous hyperparameters [15]. Therefore, BO was run in parallel to accelerate the tuning process for hyperparameters in categorical dimensions such as activation and weight initialization. Table 3 showed the effects of hyperparameter tuning for the entire activation function and the initial kernel function.

<sup>a.</sup> for base value learning rate= 0.00001, number of neuron =30, and batch size=256

There were 5 activation functions of ReLU variants evaluated in the experiment. Each of these activation functions was tested using various weight initialization functions. So there were 35 kinds of combinations between the activation function and the kernel initialization. The deep learning model is evaluated with 35 combinations with the hyperparameter tuning BO process using the Gaussian Process for the value of learning rate, number of nodes and batch\_size. The base value of the variety of the activation and kernel initialization functions uses the learning rate = 0.00001, the number of neurons in the hidden layer = 30 and batch\_size = 256.

Fig. 2. Performance-based model based on combination activation and kernel initialization using base value before tuning hyperparameter

The SELU activation function dominates the other activation functions for the whole weight initialization function in table 3 and Figure 2. SELU is a self-normalizing development of ELU, makes learning particularly robust and faster [20]. And the highest accuracy of 87.91 % is achieved by he\_uniform weight initialization. Figure 2 also shows that the ReLU activation function is relatively stable for base value.

Fig. 3. Performance-based model based on combination activation and kernel initialization after tuning hyperparameter

We can observe the training process time for the base value in Table 3. With the same hyperparameters, it points out that PReLU activation function is the activation function with the fastest training process. It shows that PReLU tends to perform better for a limited number of epochs than ReLU. In the meantime, ELU activation function is the activation function with the longest learning time. It indicates that ELU is slightly slower to train from these findings. The ELU function has an exponential computation that slows down the process [21]. Meanwhile, the effect of weight initialization is not significant due to the unpredictable random factor.

After the hyperparameter tuning process with the total number of evaluations was carried out for each combination n calls = 15, the entire model has been evaluated with as much as 525 options. Table 3 and Figure 3 show that, after tuning

with BO and Gaussian Process, the accuracy value increases to over 98.3%. Using the ELU activation function, normal weight initialization, learning rate value at 0.0085, number of nodes 37 and batch size 64, the results of the best accuracy value reaching 99.991%.

Figure 3 also indicates the accuracy of the LeakyReLU and PReLU activation functions underperformed due to other activation functions. For all the tests performed, the LeakyReLU alpha value was 0.01. The effects of LeakyReLU could be affected by choosing the  $\alpha$  value which is not the optimal. Similarly, PReLU activation used only the default value of the keras library in the experiment. There are several alpha parameters PReLU itself, such as initialization, restriction and regularizer, which must be tuned also to obtain optimum value. Figure 3 also indicates the efficiency of the LeakyReLU and PReLU activation functions underperformed due to other activation functions.

The BO procedure searches hyperparameters based on the search-space dimension range on the learning rate, batch size and number of hidden nodes. Figure 4 described the search space dimension on the objective function for the ELU activation function and normal weight initialization. The value of partial dependencies is determined by calculating the average target value of many random samples for the dimension of the learning rate, batch size and the number of nodes. The red star indicates the best-observed value. In Figure 5, the best value for the study rate is 0.0085, batch\_size is 64  $(2^6)$  and the dense number 37. In the figure, the closer the average accuracy as objective value is to 0.01 (low = 1e-6, high = 1e-2). The higher the average accuracy. Similarly, the higher the number of nodes, the higher the average accuracy of the objective value. In table 3, most of the best values are obtained in the number of nodes in the hidden layer at the largest value of the dimensional interval (low = 20, high = 45).

Fig. 4. Partial Dependence plots of the objective function in ELU as activation function and kernel\_initialization normal

The effect of variable continuous hyperparameters that are tuned based on the impact of increasing accuracy performance can be evaluated from the general results of various combinations of hyper-parameters (Figure 5). The results of the different combinations of hyperparameters were tested with a random forest regressor to decide the hyperparameters features had the greatest effect on the increased accuracy. And results are shown to be the learning rate followed by the batch size value for that have a significant impact on improving accuracy. In contrast, the number of neurons doesn't have a considerable effect on classification accuracy.

Fig. 5. Feature Importance of Continous hyperparameters

#### B. Performance Evaluation and comparison

After finding the best model for all ReLU, ELU, SELU, LeakyReLU and PReLU activation functions, the best model is evaluated using a testing-set. Table 4 summarizes the findings of the best model assessment.

TABLE IV. EVALUATION OF BEST MODEL IN TESTING-SET

Activation	weight	Data	Train	Data Test	
function	intialization	Loss	Accuracy	Loss	Accuracy
ELU	normal	0.000657	0.999915	0.001214	0.999931
SELU	lecun_normal	0.000729	0.999905	0.000854	0.999920
ReLU	lecun_normal	0.000907	0.999892	0.001423	0.999890
LeakyReLU	glorot_uniform	0.066026	0.986534	0.069737	0.985508
PReLU	normal	0.067739	0.986068	0.070105	0.985264

The best score for the ELU activation function on the testing set is 99,993%. The best accuracy as objective function value is close to 100 % for any weight initialization with the hyperparameters of the search space (15 calls). Hyperparameter tuning with Gaussian method accelerates the deep-learning model's convergence, while in autoencoder as well as in deep neural network processes the number of the epoch was only 10.

After running all those experiments, the activation function indeed affect the final accuracies and the losses. ELU activation is robust than ReLU, SELU, Leaky ReLU and PReLU activation functions. The discussion of previous studies by Pedamonti [20] supported this finding. Furthermore, the stability of the activation function must be considered when selecting it. The results show that after tuning, LeakyReLU and PReLU are significantly less accurate than other activations. So it is necessary to determine the value of the alpha parameter for both activation functions.

Overall, the results obtained using just a small epoch with BO's hyperparameter tuning method are very strong with classification results will exceed 99.993% even with a small number of epochs (10 epochs in the pre-training method and 10 epochs in the classification process). Compared to some previous studies using the same data set for multiclass classification, the detection rate (weighted overall accuracy) results achieved are superior. As in previous studies by Alkadi et al. [22] using Mixture Localization-based Outliers (MLOs) and Gaussian mixture model to classify multiclass attacks trends of only 97.98%. Similarly, the best results for deep autoencoder models with a detection rate of 98.394% were obtained for research carried out by Ferrag et al. [4] which evaluated several deep learning models. Khraisat et al. [23] proposed a hybrid intrusion detection system using an ensemble method for the same datasets with features selection. The detection rate of the proposed model was 99.97%.

Finally, our experiment has shown that the performance depends on how we change the optimizer hyperparameters and how we set up our deep learning model. In this study, ELU activation and normal weight initializer with Bayesian optimization using the Gaussian process were better than the others, but this may not be the case with other tasks and other data. In developing a deep learning model, multiple possibilities need to be tested, and hyper-parameter selections used to evaluate which options are best.

#### V. CONCLUSION

We proposed in this study deep learning models in framework using intrusion detection unsupervised autoencoder and supervised deep neural networks using the Bayesian hyperparameter optimization method. With the hyperparameter tuning process using Bayesian optimization, the detection rate value of the BoT-IoT dataset has been increased to 99.993%, which is higher than the previous state of the art. From the results of the best model after hyperparameter tuning, it was found that compared to the evaluated ReLU variant, the ELU activation function provided the best performance. Based on the obtained results, the learning rate value is the continuous parameter, which influences most in deep learning performance, while batch sized and the number of hidden layer nodes has no significant effect.

In the future, we will evaluate the deep learning model by adding the number of hidden layers and other hyperparameters and comparing them with various deep learning methods and various datasets.

#### ACKNOWLEDGMENT

The authors would like to thank data science research group, Universitas Bina Darma, and University for support and facilities.
