Control Flow Statements Selection by Using If and Else
Introduction

- Generally, there are three structure of a program, namely:
  - Sequence - execute one statement after another.
  - Choice/Decision/Selection - execute only one several statements depending on a condition (if and switch statements).
  - Repetition - execute some statements repetitively (while, for, do...while).
Introduction

- The statements inside your source files are generally executed from top to bottom (sequentially, from one statement to the next), unless you divert the flow using a flow-of-control construct.), in the order that they appear.
- *Control flow statements*, however, break up the flow of execution by employing decision making, looping, and branching, enabling your program to *conditionally* execute particular blocks of code.
- This section describes:
  - the decision-making statements (if-then, if-then-else, switch),
  - the looping statements (for, while, do-while), and
  - the branching statements (break, continue, return) supported by the Java programming language.
Decision, Conditional, Choice, Branch

- The if-then statement is the most basic of all the control flow statements. It tells your program to execute a certain section of code only if a particular test evaluates to true.

- The if-then and if-then-else conditional statements let a Java program make simple decisions about what to do next. They work in the same logical way as we do when making decisions in real life.

- For example, when making a plan with a friend, I could say "If Mike gets home before 5.00pm then we'll go out for an early dinner." When 5.00pm arrives, the condition (i.e., Mike is home), which determines whether we all go out for an early dinner, will either be true or false. It's works exactly the same in Java.
The syntax

- The simplest such construct in Java is the if statement, which reads like "if something is true, then do this before continuing." It is written:

```java
if (<Boolean expression>) {
    <Embedded statements>;
}
```

- Or

```java
if (<Boolean expression>){
    <then-statements>;
}
else if {
    <else-statements>;
}
else {
    <else-statements>;
}
```

Leon Abdillah - A&SD - Decision, Choice, Condition, Branch
Notes

- The expression must be boolean.
- The braces are not necessary if there is only one statement, but it's a common style to always use them.
Example If with 1 condition 1/2

```java
package Package04;

import java.util.Scanner;

public class Decision1 {

    public static void main(String[] args) {

        Scanner scInput = new Scanner(System.in);
        String ket = "";

        System.out.print("Input bilangan : ");
        int bil = scInput.nextInt();

        if (bil >= 55) {
            ket = "Lulus";
        }

        System.out.println("Dengan Nilai " + bil + ", Anda dinyatakan " + ket);
    }
}
```
Example If with 1 condition 2/2

```
Console
<terminated> Decision1 [Java Application] C:\Program Files (x86)\Java\jre7\bin\javaw.exe (22/10/2012 9:14:58 AM)
Input bilangan : 60
Dengan Nilai 60, Anda dinyatakan Lulus

Console
<terminated> Decision1 [Java Application] C:\Program Files (x86)\Java\jre7\bin\javaw.exe (22/10/2012 9:15:53 AM)
Input bilangan : 50
Dengan Nilai 50, Anda dinyatakan
```
Example If with 2 conditions 1/2

```java
package Package04;

import java.util.Scanner;

public class Decision1 {
    public static void main(String[] args) {
        Scanner scInput = new Scanner(System.in);
        String ket = "";

        System.out.print("Input bilangan : ");
        int bil = scInput.nextInt();

        if (bil >= 55) {
            ket = "Lulus";
        } else {
            ket = "Tidak Lulus";
        }
        ket = "Tidak Lulus";

        System.out.println("Dengan Nilai " + bil + ", Anda dinyatakan " + ket);
    }
}
```
Example If with 2 conditions 2/2

Console
<terminated> Decision1 [Java Application] C:\Program Files (x86)\Java\jre7\bin\javaw.exe (22/10/2012 9:19:17 AM)
Input bilangan : 75
Dengan Nilai 75, Anda dinyatakan Lulus

Console
<terminated> Decision1 [Java Application] C:\Program Files (x86)\Java\jre7\bin\javaw.exe (22/10/2012 9:20:05 AM)
Input bilangan : 50
Dengan Nilai 50, Anda dinyatakan Tidak Lulus
The Equality and Relational Operators

- The equality and relational operators determine if one operand is greater than, less than, equal to, or not equal to another operand. The majority of these operators will probably look familiar to you as well. Keep in mind that you must use "==", not "=". when testing if two primitive values are equal.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>==</td>
<td>equal to</td>
</tr>
<tr>
<td>!=</td>
<td>not equal to</td>
</tr>
<tr>
<td>&gt;</td>
<td>greater than</td>
</tr>
<tr>
<td>&gt;=</td>
<td>greater than or equal to</td>
</tr>
<tr>
<td>&lt;</td>
<td>less than</td>
</tr>
<tr>
<td>&lt;=</td>
<td>less than or equal to</td>
</tr>
</tbody>
</table>
Example – Operational Operators 1/2

```java
package Package04;

import java.util.Scanner;

public class RelationalOperators {

    public static void main(String[] args) {
        Scanner scIn = new Scanner(System.in);

        System.out.printf("%s : ", "Input Value 1");
        int value1 = scIn.nextInt();
        System.out.printf("%s : ", "Input Value 2");
        int value2 = scIn.nextInt();

        if (value1 == value2) {
            System.out.println("value1 == value2");
        }
        if (value1 != value2) {
            System.out.println("value1 != value2");
        }
        if (value1 > value2) {
            System.out.println("value1 > value2");
        }
        if (value1 < value2) {
            System.out.println("value1 < value2");
        }
    }
}
```
Example – Operational Operators 2/2

```
<terminated> RelationalOperators [Java Application] C:\Program Files (x86)\Java\jre7\bin\javaw.exe (22/10/2012 9:44:22 AM)
Input Value 1 : 10
Input Value 2 : 15
value1 != value2
value1 < value2
value1 <= value2

<terminated> RelationalOperators [Java Application] C:\Program Files (x86)\Java\jre7\bin\javaw.exe (22/10/2012 9:45:15 AM)
Input Value 1 : 15
Input Value 2 : 15
value1 == value2
value1 <= value2

<terminated> RelationalOperators [Java Application] C:\Program Files (x86)\Java\jre7\bin\javaw.exe (22/10/2012 9:46:18 AM)
Input Value 1 : 25
Input Value 2 : 20
value1 != value2
value1 > value2
```
The Conditional (Logical) Operators

- The && and || operators perform Conditional-AND and Conditional-OR operations on two boolean expressions.
- These operators exhibit "short-circuiting" behavior, which means that the second operand is evaluated only if needed.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&amp;&amp;</td>
<td>Conditional-AND</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Example Conditional Operators 1/2

```java
package Package01;

public class ConditionalOperators {

    public static void main(String[] args) {

        System.out.println("Operasi AND");
        System.out.println("true && true = " + (true && true));
        System.out.println("true && false = " + (true && false));
        System.out.println("false && true = " + (false && true));
        System.out.println("false && false = " + (false && false));

        System.out.println("\nOperasi OR");
        System.out.println("true || true = " + (true || true));
        System.out.println("true || false = " + (true || false));
        System.out.println("false || true = " + (false || true));
        System.out.println("false || false = " + (false || false));

        int value1 = 1;
        int value2 = 2;

        if((value1 == 1) && (value2 == 2))
            System.out.println("\nvvalue1 is 1 AND value2 is 2");
        if((value1 == 1) || (value2 == 1))
            System.out.println("value1 is 1 OR value2 is 1");
    }
}
```
Example Conditional Operators 2/2

Score
Nilai $\geq 54$; Hadir $\geq 80\%$ = Lulus
Nilai $\geq 54$; Hadir $< 80\%$ = Tidak Lulus
Nilai $< 54$; Hadir $\geq 80\%$ = Tidak Lulus
Nilai $< 54$; Hadir $< 80\%$ = Tidak Lulus

JobVacancy
BisaComputer; BisaEnglish = Diterima
BisaComputer; TakbisaEnglish = Diterima
TakbisaComputer; BisaEnglish = Diterima
TakbisaComputer; TakbisaEnglish = TakDiterima

Operasi AND
true && true = true
true && false = false
false && true = false
false && false = false

Operasi OR
true || true = true
true || false = true
false || true = true
false || false = false

value1 is 1 AND value2 is 2
value1 is 1 OR value2 is 1
The Ternary Operator (? : )

- Another conditional operator is `? :`, which can be thought of as shorthand for an if-then-else statement.
  - `boolean expression ? operand1 : operand2;`
- This operator is also known as the *ternary operator* because it uses three operands.
- In the following example, this operator should be read as:
  - "If someCondition is true, assign the value of value1 to result.
  - Otherwise, assign the value of value2 to result."
The Ternary Operator (?:)

```java
if (a > b) {
    max = a;
} else {
    max = b;
}
max = (a > b) ? a : b;
```
Example Ternary Operator 1/2

```java
package Package04;
import java.util.Scanner;
public class TernaryOperator {

    public static void main(String[] args) {
        Scanner scnr = new Scanner(System.in);
        int number1 = 0;
        int number2 = 0;
        int maximum = 0;

        System.out.print("Enter first numbers: ");
        number1 = scnr.nextInt();
        System.out.print("Enter second numbers: ");
        number2 = scnr.nextInt();

        maximum = (number1 < number2) ? number2 : number1;

        System.out.print("The maximum of ");
        System.out.print(number1);
        System.out.print(" and ");
        System.out.print(number2);
        System.out.print(" is ");
        System.out.println(maximum);
    }
}
```
Example Ternary Operator 2/2

```
Enter first numbers: 10
Enter second numbers: 20
The maximum of 10 and 20 is 20
```

```
Enter first numbers: 25
Enter second numbers: 15
The maximum of 25 and 15 is 25
```
